Current shunts are typically designed to deliver 100 millivolts at full scale current, which can be hundreds of amperes. Figure 1 is a schematic representation of our motor application that shows a 480-volt source voltage connected to a motor armature through a series current shunt. Also shown is the voltage across the shunt (V_s) and the ...

Current Sensing in EVSE - TI Training

An isolated current shunt transducer includes a current shunt that produces a voltage difference between the current shunt's first and second ends, with the voltage difference being related to a current flowing through the current shunt. The transducer also includes an isolation barrier positioned between the current shunt and a processing circuit to isolate the processing circuit from a ...

ISOLATED CURRENT MEASUREMENT. The simplest method of sensing the current in a electric circuit is by measuring the voltage drop across a known resistance in the current path. This resistor is commonly referred to as a shunt resistor. Although shunt means a parallel resistor, this name is used to refer to the parallel connection with the voltmeter.

For example, a 500 A, 75 mV shunt would have a resistance of 150 microhm, a maximum allowable current of 500 amps and at that current the voltage drop would be 75 millivolts. By convention, most shunts are designed to drop 50 mV, 75 mV or 100 mV when operating at their full rated current and most ammeters consist of a shunt and a voltmeter with full-scale deflections of 50, 75, or 100 mV.
